13.1 RNA Lesson Objectives Contrast RNA and DNA. Explain the process of transcription. Lesson Summary The Role of RNA RNA (ribonucleic acid) is a nucleic acid like DNA. It consists of a long chain of nucleotides. The RNA base sequence directs the production of proteins. Ultimately, cell proteins result in phenotypic traits.

RNA and Protein Synthesis

RNA and Protein Synthesis (Chapter 13) Messenger RNA, transfer RNA, and ribosomal RNA work together in prokaryotic and eukaryotic cells to translate DNA's genetic code into functional proteins. These proteins, in turn, direct the expression of genes. 13.1 RNA. The main differences between RNA and DNA are that (1) the sugar in RNA is ribose instead of deoxyribose; (2) RNA is generally single-stranded, not double-stranded; and (3) RNA contains uracil in place of thymine.
