Evolutionary ecology lies at the intersection of ecology and evolutionary biology. It approaches the study of ecology in a way that explicitly considers the evolutionary histories of species and the interactions between them. Conversely, it can be seen as an approach to the study of evolution that incorporates an understanding of the interactions between the species under consideration. The main subfields of evolutionary ecology are life history evolution, sociobiology, the evolution of inter sp

Entries in the latter category are usually (but not always; see chapter 23, by Steven A. Frank) motivated by comparative genome-level analysis. This book is intended to be a companion volume to Evolutionary Ecology: Concepts and Case Studies 2001, also coedited by Fox. While there is some overlap in the topics treated by these two books (and a recurrence of some authors in this volume), the approaches to questions and empirical examples are strikingly different.
