A four stroke engine completes its cyclic operation into four strokes of piston or two revolution of crankshaft. These strokes are suction stroke, compression stroke, power or expansion stroke and exhaust stroke.

Both SI and CI engines follow these four strokes to complete one cycle.

The first person to build a working four-stroke engine, a stationary engine using a coal gas-air mixture for fuel (a gas engine), was German engineer Nicolaus Otto. This is why the four-stroke principle today is commonly known as the Otto cycle and four-stroke engines using spark plugs often are called Otto engines.
