A remarkable and extremely important ongoing positive revolution in how we think about psychological problems is rapidly reaching a tipping point. This book provides a manifesto for this revolution. An increasing number of psychologists and psychiatrists are proposing that we either radically change the next edition of the Diagnostic and Statistical Manual of the Mental Disorders and the International Classification of Diseases or leave them behind entirely. The author argues for a view of psychological problems that is far less stigmatizing and better supported by the data but which will require large changes in thinking. First, there is no clear distinction between "normal" and "abnormal" psychological

functioning. Psychological problems do not reflect rare and terrifying "illnesses" of the mind, but are problematic ways of thinking, feeling, and behaving that lie on continuous dimensions from minor to severe. Crucially, psychological problems are ordinary aspects of the human experience. They are ordinary in the sense of being commonplace-the great majority of us will experience distressing and disruptive psychological problems at some time during our lives-and are ordinary in arising through the same natural interplay of genetic and environmental influences as any other aspect of behavior. The dimensions of psychological problems are highly correlated and these correlations provide vital clues as that allow us to see a hierarchy of causes of psychological problems for the first time. These range from factors that influence the likelihood of exhibiting some kind of psychological problem, but not which kind, to highly specific causes.

Although there has been a significant increase in studies of stress and coping processes in recent years, researchers have often approached these topics from rather narrow and constrained perspectives. Furthermore, little communication has occurred across disciplines and research directions, resulting in the emergence of several relatively isolated literatures. An outgrowth of the Eleventh Biennial West Virginia University Conference on Life-Span Development, this volume emphasizes two major themes: the importance of taking a life-span approach to the study of stress and coping, and the development of new and more complete conceptual models of stress and coping processes. The first to approach these subjects from a life-span perspective, this book includes papers by distinguished researchers from each of the major periods of the life-span, and brings together the cognitive and socioemotional traditions in the study of dealing with pressures. The editors hope that this facilitation of communication among researchers with diverse views will help create a broadening and integration of perspectives.

these problems, the study of male psychology has either been overlooked, or viewed as a problem of defective masculinity. This handbook brings together experts from across the world to discuss men's mental health, from prenatal development, through childhood, adolescence, and fatherhood. Men and masculinity are explored from multiple perspectives including evolutionary, cross-cultural, cognitive, biological, developmental, and existential viewpoints, with a focus on practical suggestions and demonstrations of successful clinical work with men. Throughout, chapters question existing models of understanding and treating men's mental health and explore new approaches, theories and interventions. This definitive handbook encapsulates a new wave of positive theory and practice in the field of male psychology and will be of great value to professionals, academics, and those working with males through the lifespan in any sector related to male mental health and wellbeing.
